Furbearer Harvests in North America, 1600 - 1984

The present volume is a supplement to Wild Furbearer Management and Conservation in North America edited by M. Novak, J. A. Baker, M. E. Obbard, and B. Malloch (ISBN 0-7743-9365-3). In a up-to-date, authoritative, and factual manner Wild Furbearer Management and Conservation in North America examines all aspects of the biology and management of North American furbearers. Topics discussed range from the archaeological evidence for the use of furbearers by aboriginal peoples to modern population management techniques, from a trapper's memories of early days on the trapline to a discussion of modern humane harvesting methods, and from the effects of toxic chemicals on furbearers to present-day management programs across North America. This 1,150-page, hard-bound volume is fully illustrated in both color and black-and-white. Both publications are available from the Ontario Trappers Association, Education Division, 1971 Bond Street, P.O. Box 705, North Bay, Ontario, Canada P1B 8J8. Tel. (705) 476-8777.

INTRODUCTION

In this supplement to Wild Furbearer Management and Conservation in North America (Novak et al., editors 1987) we present information on the annual harvests of North American furbearers from the early 1600s to the present. The tables of data are arranged alphabetically by species; pre-20th century data are given first, followed by 20th century data.

The pre-20th century data are arranged by fur trading company, group of companies, trading interests, or geographical region. For example, the "Dutch" category includes harvests for the West India Company, New Netherlands, and New Sweden, and, later, the trade of English merchants at Albany. The "American" category is a combination of harvest data for several companies and geographic regions of present-day United States, such as the American Fur Company, Pacific Fur Company, Columbia Fur Company, independent American mountain men centered at St. Louis, various Spanish companies headquartered at St. Louis, and traders who operated in New Mexico, Mexico, and California but were centered at such places as Santa Fe. This category also includes data on the fur trade conducted by early English colonial interests such as the Plymouth Company and the Virginia Company. The "Russian" category includes data for all Russian companies that operated in North America, although the most complete data are for the Russian-American company after 1799. Obbard et al. (1987) and Ray (1987) provide more detailed information on the various companies involved in the North American fur trade.

Sources of the data presented in the tables of the pre-20th century harvest are: **French trade** (Murray 1936, Lawson 1943, Phillips 1961, Kupp 1968); **Dutch trade** (Murray 1936, Phillips 1961, Kupp 1968, Norton 1974); **Hudson's Bay Company** (Poland 1892, Seton 1911, Innis 1927, Lawson 1943, Umfreville 1954, Phillips 1961); **American Companies** (Poland 1892, Innis 1927, Roberts 1958, Phillips 1961, Weber 1971, Wishart 1979); **Russian Companies** (Berkh 1974, Makarova 1975, Tikhmenev 1978); **North West Company** (Davidson 1918, Innis 1956, Phillips 1961).

The 20th century harvest data are presented by jurisdiction in both

Canada and the United States; totals are also presented for the Canadian, U.S., and combined harvest. Note that the average price included with the Canadian data in the tables is not the same as that shown in the Statistics Canada annual reports (Statistics Canada 1920-85). Rather, to facilitate comparisons across decades, average pelt prices were adjusted for the rate of inflation. Average prices given by Statistics Canada (1920-85) were adjusted by the Canadian Consumer Price Index K8-18 series where 1971 $CDN=1.0 (Statistics Canada 1985); these adjusted average prices are given in our tables.

For the period 1900-09, harvest data come from Seton (1911). For most species published data are generally unavailable for the decade 1910-19. Most of the data we report for Canada in the 20th century come from Statistics Canada (formerly Dominion Bureau of Statistics) annual reports (Statistics Canada 1920-85) which were published only after 1919. There are few data for U.S. harvests prior to 1934. For the period 1931-32 to 1969-70, the data for U.S. harvests come from U.S. Department of Agriculture (1939) and U.S. Department of the Interior (1948-71) reports. The U.S. data for the period 1970-71 through 1976-77 were collected for the International Association of Fish and Wildlife Agencies (IAFWA) and compiled by G. Deems and D. Pursley (Maryland For., Parks and Wildl. Serv.). The data from 1970-71 to 1975-76 were published in Deems and Pursley (1978). U.S. harvest data since 1977-78 were collected by the IAFWA and compiled with additional editing of the early 1970s data by G. Linscombe (Louisiana Dep. Wildl. and Fish.). The edited version of the Deems and Pursley (1978) data set is presented in our tables.

Both Canadian and U.S. harvests for all species for 1982-83 and 1983-84 come from a survey of the hunter and trapper harvest of furbearers in all jurisdictions in North America conducted by the Fur Management Section, Wildlife Branch, Ontario Ministry of Natural Resources. These are the only years for which reliable hunter harvest data are available for most species. It should be emphasized that the harvest data presented elsewhere in this chapter are largely trapper harvests.

The bear harvest data for the 1970s are with a few exceptions the result of a survey conducted by the Fur Management Section, Wildlife Branch, Ontario Ministry of Natural Resources. This survey obtained a breakdown of the number of bears harvested by trappers and hunters in each jurisdiction. Data on the hunter harvest of bears were sought because the hunter harvest of these species is substantial and does not ordinarily appear in reports of the harvest (e.g., Statistics Canada 1920-85). Supplemental information on the bear harvest, especially the native subsistence harvest of brown bears and polar bears, come from McKnight (1971, 1974), Greer (1972), Prevett and Kolenosky (1982), Amstrup et al. (1986), R. Hall (pers. commun., Northwest Territories data), and S. Schliebe (pers. commun., Alaska data).

LIMITATIONS OF THE DATA SET

Many problems arose while researching the fur harvest prior to the 20th century, the major one being missing data. Fairly complete data sets are published only for the Hudson's Bay Company's operations across Canada and in some parts of the United States. Less complete than the Hudson's Bay Company data are the data for the early French harvests, Dutch and English trapping activities in the northeastern United States during the 17th century, for Russian fur harvests in present-day Alaska and British Columbia, and for the North West Company. However, there are only scattered records for most geographic regions of present-day United States, especially the Southwest, Northwest, and Midwest. This is a serious gap in the data, because we know from historical sources that throughout the 19th century extensive fur trapping took place in this large area, especially west of the Mississippi and Missouri rivers to the Rocky Mountains (Chittenden 1902, Houck 1908, 1909; Cleland 1950). Thus the lack of harvest data for a particular company or region does not necessarily reflect a lack of trapping activity or unsuccessful trapping so much as it reflects a lack of reliable records of the trade. A related problem to missing data for companies or regions was the lack of records of trade for many species. The beaver was the most highly valued species in the fur trade prior to the 20th century, and the historical records of the trade reflect this. Generally, records for the beaver harvest are fairly complete, but detailed data for other species are lacking in the records of the French trade or in those for the midwestern United States.

Due to time constraints, we relied on secondary sources rather than on original material in obtaining harvest totals. This gave rise to another problem in the collection of data. Often when a year's harvest for the same area was recorded by more than one source, the separate sources reported different numbers of animals taken. For example, Poland (1892) contained detailed information on the Hudson's Bay Company's harvests from 1752 to 1890, which are derived from sales records of the Hudson's Bay Company in London, but other sources often gave quite different harvest figures. We were reluctant to simply average these reported harvest values because in many instances the differences were extremely large. So, to be conservative in our harvest estimates and to be consistent, we used the lowest figure reported for a species for an area in a given year, regardless of the source. Similarly, where a range was given for the harvest in any one year or for a period of years (e.g., 2,000-3,000 beaver pelts obtained in 1647), the lower end of the range was reported as the harvest. However, where we obtained harvest data for a single "company" from different localities all for the same year (e.g., American category pre-20th century), the harvest for that year for that "company" was obtained by summing the harvests for the different localities.

In certain cases both the total harvest taken over a number of years and the harvest for a single year (or years) within that period were reported by different sources. In such cases the number of pelts harvested for each year of that period was obtained by subtracting the harvest for the individual year(s) from the total harvest and dividing the remainder by the number of years in the period minus the number of years for which the individual harvest data were available. For example, if 250 pelts were taken between 1820 and 1830, and if 50 pelts were taken in 1825 alone, then the number of pelts taken for every year (except 1825) of this period would have been 250 minus 50 divided divided by 10 years (11-1), or 20 pelts per year.

Where an average harvest was given for a period, we reported that average figure as the harvest for each year of that period. For example, if a source reported that an average of 3,000 furs was harvested in each year of a 10-year period, we showed 3,000 furs as being harvested in each of the 10 years.

In other cases the average harvest for a number of years and the harvest for a particular year in that period were reported. In such cases the average value was first multiplied by the number of years in the period. Then the harvest for the individual year(s) was subtracted from this total, and the remainder was divided by the number of years in the period minus the number of years for which individual harvest data were available.

Where a zero harvest for a species was recorded in the literature, we have reported it as a zero harvest. However, a blank (i.e., lack of reported data) in the tables of harvest data does not necessarily indicate that no harvest of that species occurred in that year. A blank could also result from the lack of adequate harvest records.

The harvest for a species was not always recorded by the number of pelts. For example, the beaver harvest was sometimes recorded by the weight of pelts. Where the beaver harvest was given in pounds, a conversion of 1.5 pounds per beaver was used to give the number of pelts harvested (Cleland 1950). Where the weight of the French harvest was given in livres, a livre was considered equivalent to a pound (Phillips 1961). Another technique was to record the number of packs of skins traded. In the case of the beaver, it was assumed that one pack of beaver skins contained 100 pounds of beaver, or about 70 pelts (Wishart 1979).

INTERPRETING THE DATA

It must be emphasized that the data cannot simply be taken to indicate changes in the harvest, population levels, or even harvest effort. First and foremost, as stated elsewhere, hunter harvests usually have not been reported and hence the harvest data presented here are largely only trapper harvests. In addition, individuals of certain species (e.g., skunks (_Mephitis_ spp., _Spilogale_ spp.), raccoons (_Procyon lotor_), bears (_Ursus_ spp.), coyotes (_Canis latrans_), beavers (_Castor canadensis_), red foxes (_Vulpes vulpes_), muskrats (_Ondatra zibethicus_), and opossums (_Didelphis virginiana_)) are sometimes removed when they prove a nuisance to humans. Although in certain cases the number of nuisance animals removed may be substantial, usually such removals are not included in harvest figures (Andelt 1987). Certain species (e.g., opposums and raccoons) are sometimes shot and eaten, but again the level of this type of harvest is usually unrecorded. Whereas individuals of certain species (e.g., skunks) are sometimes captured incidentally to a desired species and may not be included in the harvest, the harvest of other species (e.g., brown bear (_Ursus arctos_), polar bear (_Ursus maritimus_), sea otter (_Enhydra lutris_)) may be restricted (Obbard _et al_. 1987) to varying extents. (A more detailed examination of the harvest of each of the furbearing species and the various factors affecting the harvest can be found in Obbard _et al_. (1987)). All these factors will affect estimates of either the total harvest or the population size that are based on harvest data. Additionally, there are many outside factors that influenced the annual records of harvest, including declines in local populations of furbearers, natural fluctuations in populations of fubearers, changes in market demands, the Indian demand for trade goods, local and European wars, epidemics that affected Indian tribes, whether pelts were held over from one year to the next, and whether trading ships successfully reached either the ports in North America or the home ports in Europe.

Species such as the lynx (Felis lynx), muskrat (Ondatra zibethicus), arctic fox (Alopex lagopus), marten (Martes americana), and possibly fisher (M. pennanti), naturally experience fluctuations in population levels over time (Keith 1963). Hence, large fluctuations in the size of the harvest for such species does not necessarily suggest that changes in population sizes have been caused by exploitation. Those individuals using the harvest data to examine population cycles, are cautioned that trapping season dates may change over a period of years and also that, daily bag limits, season limits or quotas may be in effect for certain species. All these factors influence harvest levels. For example, the harvest of lynx (Felis lynx) in Ontario may decrease in certain years as a result of imposed quotas.

Natural disasters may also affect harvest levels. For example, in 1800, populations of martens, muskrats, and beavers were reduced by fires in Saskatchewan, and a "distemper" (probably tularemia) further reduced local beaver populations (Carlos 1979). It is likely that other "disasters", which were not well-documented, might also have lowered population levels, although the drop may have been noticable only in local returns. Even the occurrence of a particularly severe winter could have seriously lowered local returns, not only by directly reducing the number of furbearers but also by reducing the numbers of harvesters or their ability to trap effectively. For example, such an incident occurred at Brunswick House in 1818, when no furs were traded (Rich 1960). Illness among the natives also affected the numbers of furs obtained at trading posts. In 1782, the trade at both Hudson House and Cumberland House was severely restricted because Indians were dying from smallpox (Rich 1960).

Harvest levels were also influenced by various political factors. It is well-documented that for many years there were intense rivalries among the various nations and companies involved in the fur trade. As strategic trading posts changed hands, so did the fur stocks. A rival company might offer more attractive goods or better value to the native trappers to lure them to their post, which meant that returns at that post increased as returns at another post dropped.

Shipping policies also affected yearly figures, because furs were not necessarily shipped out the same year that they were trapped. Partly, this was due to the influence of the weather on shipping patterns - ships might not be able to arrive at or leave ports because of bad weather. Therefore, much of the harvest data reflects what was received through a port rather than what was trapped that year. Changes occurring in local populations of furbearers could also be masked when and if a fur trading company expanded its range of influence or trapping. For example, the Dutch, the English at Plymouth, and the French were all experiencing regional shortages by the 1630s, but all three groups actually were able to increase their fur returns by aggressively expanding into new territory. And again, although by the 1820s furbearer populations, especially of beavers, were greatly reduced well into the prairie regions, the Hudson's Bay Company's total returns did not seriously drop in this time period because the company continued to expand westward, especially after its merger with the North West Company.

A conflict also existed between the fur trade companies, which were continually attempting to increase the harvests, and the Indian trappers who resisted this pressure. This was because the Indian demand for trade goods from year to year was relatively stable, partly because of their nomadic lifestyle but also because of their limited capabilities to transport goods. As a result Indian trappers usually brought only enough furs to the fort to obtain these basic goods. Additionally, because Indians placed little value on the accumulation of material possessions - indeed the hoarding of material goods was considered to be antisocial behavior (Ray and Freeman 1978:58), they were not interested in increasing their harvests to get more supplies. In fact, if the traders gave more favorable terms of trade, the Indians brought in fewer furs to the fort because fewer furs were needed to obtain the same quantity of goods (Ray 1974, Heidenreich and Ray 1976). Furthermore, an exchange of gifts during preliminary ceremonies was an important component of the annual trading session (Ray and Freeman 1978:54-62). This combined with the Indians' unchanging demand for trade goods, meant that companies were pressed to find new trading items to tempt the Indians to increase the number of pelts they brought in. As a consequence, rum and brandy became the chief commodities given to the Indians as gifts during the preliminary ceremonies (Heidenreich and Ray 1976).

IN THE FUTURE

As we have indicated above, there are several problems associated with the collection, verification and interpretation of harvest data. The frustrations we experienced in collecting and verifying the data indicated to us the need for greater care and effort in the continued collection of furbearer harvest data. Therefore, the authors would like to extend an appeal to the readers for 1) any additional well-documented harvest information they might have and 2) continued carefulness and diligence in the collection of future harvest data. We would also like to suggest that in order to avoid under reporting of the harvest, all reporting of the harvest should be done only after the trapping year is over. Because of the importance of harvest data and their usefulness to a large and varied reading group, we would also like to suggest that the Federal Governments should take responsibility for the collection and maintenance of the harvest data set.

BEARS

Black Bear *Ursus americanus*

Brown Bear *Ursus arctos*

Polar Bear *Ursus maritimus*

COMMENTS

Prior to the 20th century, records of sales of bear pelts were not separated into the three species but were lumped into a single category of "Bears". No doubt, most bears harvested were black bears, but brown bears must have been harvested especially in the Rocky Mountains and polar bears may have been taken in the vicinity of Hudson Bay and James Bay. Data on the combined harvest of bears in the pre-20th century period are given in Table 2.

Beginning in the 20th century, bear harvest data are separated by species (Tables 3, 4, 5). However, the bear harvest recorded by Statistics Canada (1920-1985), U.S. Department of Agriculture (1939), or U.S. Department of the Interior (1948-1971) is largely a trapper harvest, and the harvest of bears by trappers is low compared to that taken by hunters. Therefore, to better estimate the modern harvest, data on both trapper and hunter harvest of bears from 1970 to 1984 were obtained from all North American jurisdictions by a survey conducted by the Fur Management Section, Wildlife Branch, Ontario Ministry of Natural Resources. Therefore, the bear harvest data since 1970 should more accurately reflect the actual harvest than data prior to 1970. Nevertheless, readers should remember that mandatory reporting of hunter harvest is not required by all jurisdictions so these harvest data are often estimates based on questionnaires mailed to hunters and these estimates may have wide confidence limits.

Additional information on the bear harvest, especially on the native subsistence harvest of brown bears and polar bears, come from McKnight (1971, 1974), Greer (1972), Prevett and Kolenosky (1982), Amstrup et al. (1986), R. Hall (pers. commun., Northwest Territories), and S. Schliebe (pers. commun., Alaska).

BOBCAT

Felis rufus

COMMENTS

The bobcat has been referred to in the fur trade by a variety of names including: bay lynx, cat common, lynx cat, and wild cat (Poland 1892). Currently, the fur trade uses the names lynx cat or Bob cat (sic) (Obbard 1987). Although distinctions were sometimes made between the harvest of lynx and bobcat in pre-20th century records for the American trade (Poland 1892), the two species were not always distinguished. For example, Davidson (1918) reported only "cats" for the North West Company trade. Davidson (1918) records harvest for "cats open" and "cats closed", but there is no reason to assume one method of skinning was used exclusively for either species. As a result, we have presented combined harvest for lynx and bobcat for the pre-20th century trade in Table 15. The 20th century harvest of bobcat pelts is given in Table 7; that for lynx in Table 16.

COYOTE

Canis latrans

COMMENTS

Data on the harvest of coyotes are available only for the 20th century. Given the historical range of the coyote (Voigt and Berg 1987) and the areas of operation of the fur-trading companies, the reported harvest of "wolves" in the 18th and 19th centuries must have included coyotes, but there is no way of estimating the proportion of coyotes in that harvest.

Even in the 20th century, there are periods in some jurisdictions where the harvest data for coyotes and wolves are combined. For example, from 1925-26 to 1943-44 the Manitoba coyote and wolf harvest were lumped and reported as "wolf". Because we have no way of knowing what proportion of the harvest was coyotes we have also reported this as a wolf harvest. Several northern U.S. states such as Iowa and Wisconsin listed wolf harvests but given the range of the wolf these must have been mostly or entirely coyotes, so we have listed them as such. Some southern states such as Arkansas and Texas reported wolf harvests in the 1930s, 1940s, and 1950s. These may have been red wolves (Canis rufus), or they may have been partly or mainly coyotes. As there is no way of knowing with any certainty how many of these animals were coyotes the data have been included in the wolf tables as originally reported.

A continuing problem is that of misidentification of pelts of coyotes and wolves; this is a particular problem where the ranges of both species overlap. Because there are no clear criteria for differentiating pelts of these species where they overlap in size, young wolves are often misidentified as coyotes by fur buyers (R. Lemieux pers. commun.) This causes problems because the gray wolf is listed on CITES Appendix II and export permits are required.

FOXES

Arctic Fox *Alopex lagopus*

Gray Fox *Urocyon cinereoargenteus*

Kit Fox *Vulpes macrotis*

Red Fox *Vulpes vulpes*

Swift Fox *Vulpes velox*

COMMENTS

The recorded pre-20th century harvest of foxes is generally a combined category for all species of foxes (e.g., Poland 1892, Davidson 1918). Data were apparently recorded under this combined category despite the fact that the different fox species were recognized by the fur trade. In fact, Poland (1892) discussed the average quantity of furs of each species and of each color phase imported to London, and presented a detailed breakdown of the number of each sold in 1891. Unfortunately, a similar breakdown of sales is not available for other years. As a result, the tables we present for the pre-20th century are for combined sales of all fox species (Table 10).

Recording of the 20th century harvest data for foxes was inconsistent prior to the 1970s. In Canada, separate records have been kept for each species and each color phase since 1919 (Statistics Canada 1920-1985). However, prior to the 1943-44 season the total fox harvest reported in Catalogue 23-207, Fur Production (Statistics Canada 1920-1985) included the production of ranch foxes. For those years, it was necessary to subtract the total ranch fur production given in Catalogue 23-208, Fur Farms of Canada (Statistics Canada 1920-1944) from the grand total given in Catalogue 23-207 to arrive at the wild fur harvest figure. In the United States, separate data are available for the arctic fox from 1934-35 to the present (Table 11). From 1934-35 to 1953-54, the remaining U.S. data for foxes are a composite for gray, red, and kit/swift foxes. In this period, some jurisdictions listed gray foxes or swift foxes separately, but most reported a combined figure so we have reported combined figures for these years. From 1954-55 to 1969-70, the swift fox harvest was generally not recorded and gray and red foxes were lumped together. These data are presented in Table 13 (U.S. data identified as "Foxes"). From 1970-71 to the present, separate harvest data are available for all fox species (Tables 11, 12, 13, 14).

LYNX

Felis lynx

COMMENTS

In the pre-20th century fur trade, a distinction was not always made between lynx and bobcat pelts. The bobcat was variously referred to as bay lynx, cat common, lynx cat, or wild cat by fur dealers; the lynx was referred to as lynx.

Given the Hudson's Bay Company's area of operation until the early 1800s and the geographic range of the lynx and bobcat, it seems likely that few bobcats were obtained by Hudson's Bay Company traders. Indeed, Poland (1892) noted that "cat common" were rarely imported by the Hudson's Bay Company, although a few were obtained from their Columbia Department. Both lynx and cat common are listed in the tables of quantities of non-Hudson's Bay Company furs imported to London. However, Davidson (1918) simply lists "cased" and "open" cats exported by the North West Company. As there is no reason to assume that lynx and bobcats were skinned differently, no subdivision of the harvest can be made on that basis. Because of the inconsistency in recording of these pelts we have lumped the data for the pre-20th century period; these data are presented in Table 15. The 20th century harvest data for lynx are presented in Table 16; that for the bobcat in Table 7.

COMMENTS

The 20th century Canadian harvest data for mink presented in Catalogue 23-207, Fur Production (Statistics Canada 1920-1985) are a combination of wild mink and ranch-raised mink from 1919-20 to 1942-43. As for the foxes, from 1943-44 to the present the wild mink harvest is reported separately. To arrive at the wild mink harvest for the period 1919-20 to 1942-43, it was necessary to subtract the ranch production reported in Catalogue 23-208, Fur Farms in Canada (Statistics Canada 1920-1944) from the grand total given in Catalogue 23-207. This adjusted figure is the annual harvest that we report in Table 18 for that period.

SEA OTTER

Enhydra lutris

COMMENTS

Following initial harvests in 1743 by Russian companies, the demand for the dense, luxurious fur of the sea otter coupled with the low density and rate of increase of populations resulted in overexploitation of local sea otter populations. By the 1820s sea otters were scarce everywhere throughout their range. To protect the dwindling populations, the Russian-American Company undertook various conservation measures including limited quotas and requiring that animals be captured using nets so that females and pups could be released alive (Seton 1929). After the Alaska purchase in 1867, American traders again aggressively harvested sea otters until by the 1890s the species faced near extermination. By 1911 only a few small, remnant populations remained. Commercial exploitation of sea otters was halted when an international treaty was signed in 1911 by Russia, Japan, Great Britain (for Canada), and the United States to protect the northern fur seal (Callorhinus ursinus) and the sea otter.

No harvest data are shown in our tables after 1891. However, after several decades of recovery, populations in Alaskan waters were thriving and the Alaska Department of Fish and Game introduced a trial harvest in 1962. More intensive harvesting using hired Aleut hunters captured 2,933 animals between 1967 and 1971; in five auctions held from 1968 to 1972, 2,717 pelts were sold at an average price of $134 (Kenyon 1982, Garshelis 1987). The Alaska Department of Fish and Game halted the hunt after 1972 because of the low returns relative to the costs of hiring native hunters. No population of sea otters is currently harvested commercially.

SKUNKS

Hog-nosed Skunk *Conepatus* spp.

Hooded Skunk *Mephitis macroura*

Spotted Skunk *Spilogale* spp.

Striped Skunk *Mephitis mephitis*

COMMENTS

Pre-20th century data for skunks are not distinguished by species. The data are for both the Hudson's Bay Company and the various American companies so the reported harvest must include both striped and spotted skunks. The harvest may also include hooded skunks and hog-nosed skunks from the southwestern United States although the fur of these species was considered to be inferior in quality to that of striped or spotted skunks (Bachrach 1946). Prior to 1840, skunk skins were almost valueless and were sold in the sundry lots at the Hudson's Bay Company's sales hence records are apparently not available (Poland 1892).

Canadian harvests in the 20th century are almost entirely striped skunks. However, the spotted skunk occurs in extreme southern British Columbia and a few may be harvested each year, although the fur returns do not distinguish the species. Reporting of the U.S. skunk harvest has varied considerably in the 20th century. From 1931-32 to 1953-54 the data are largely for striped skunks but Colorado, Connecticut, Florida, Louisiana, Michigan, Montana, North Dakota, Ohio, Rhode Island, Tennessee, and Wisconsin reported a combined harvest. For all or part of this period, separate spotted skunk data are available for Arizona, Arkansas, California, Georgia, Iowa, Kansas, Louisiana, Minnesota, Mississippi, Missouri, Nebraska, New Mexico, Oklahoma, Oregon, North Carolina, Texas, and Washington. From 1954-55 to 1969-70, the data for all U.S. jurisdictions are a combined harvest. From 1970-71 to 1975-76, the data are separate for striped and spotted skunks (Deems and Pursley 1978). From 1976-77 to 1981-82, the data are once again combined (G. Linscombe and Int. Assoc. Fish Wildl. Agencies, unpubl.). O.M.N.R.'s survey for the 1982-83 and 1983-84 seasons indicated that Alabama, Arizona, Connecticut, Michigan, North Carolina, Pennsylvania, Utah, Virginia, and Washington do not distinguish the skunk species in their harvest records, and Colorado does not distinguish the species for its hunter harvest. Currently, New Mexico is the only jurisdiction to record harvests separately for striped, spotted, hog-nosed, and hooded skunks. However, because no other jurisdiction provided separate records for hog-nosed and hooded skunks, we combined these with the striped skunk for New Mexico.

WEASELS

Least Weasl *Mustela nivalis*

Long-tailed Weasel *Mustela frenata*

Short-tailed Weasel *Mustela erminea*

COMMENTS

In the pre-20th century period the trade in European ermines was extensive, but the trade in North American weasels was limited and only scattered, incomplete records exist. Poland (1892) lists a sale of about 5,400 skins by the Hudson's Bay Company in 1891, but gives no indication of whether that is a typical figure for the period. Based on British customs records, Lawson (1943) gives a few annual import totals for weasels, but no detailed information on origin of the pelts. Apparently, North American weasels were sold in the sundry lots at the fur auctions and no detailed information on sales is available (Poland 1892, Davidson 1918).

In the 20th century, both Canadian and American jurisdictions generally report a combined harvest total for all weasels. Based on OMNR's survey for 1982-83 and 1983-84 data, other than those jurisdictions that can exclude one or more species of the weasels from the harvest based on distributional information, only Colorado and Minnesota provide harvest data on separate species. As a result, the data we present are a combined total for all species of weasels present in each jurisdiction.

WOLF

Canis lupus

COMMENTS

As mentioned in the discussion of the coyote table, at least some of the pre-20th century harvest listed as "Wolf" must have been coyotes. However, there is no way of knowing what proportion of this reported harvest was coyotes so we have listed the harvest entirely as wolf as originally reported.

In the 20th century, jurisdictions such as Arkansas and Texas reported wolf harvests. These may in part have been red wolves (Canis rufus), but it seems likely that at least part of this harvest was coyotes. Nevertheless, we reported the harvest in the wolf tables because there is no way of knowing what proportion may have been coyotes. On the other hand, jurisdictions such as Iowa and Wisconsin recorded wolf harvests in the 1930s, 1940s, and 1950s. Given the range of the wolf in the United States, these must have been mainly or entirely coyotes and we have reported them as such. In Manitoba from 1925-26 to 1943-44, the harvest of wolves and coyotes was lumped and reported as "Wolf". We also have listed this combined harvest as a wolf harvest, but it should be remembered that the data include an unknown number of coyotes.

The problem of misidentification of coyote pelts as wolves persists, especially for sizes where the two species overlap (i.e., for young wolves and adult coyotes). This is a problem because wolves are listed on CITES Appendix II, and export permits must be provided.
